To Ponder

Computer Science and Engineering
The Ohio State University

What is a language?

Regular Expressions

Computer Science and Engineering College of Engineering The Ohio State University

Lecture 6

- Definition: a set of strings
- Examples
 - $\pounds \ \mathcal{L}_1 = \{ "cat", "dog", "fish" \}$
 - $\mathcal{L}_2 = \{ \alpha\beta \mid \alpha \text{ and } \beta \text{ are hex digits } \}$
 - $\blacksquare \mathcal{L}_3 = \left\{ \left. \alpha_1 \alpha_2 \alpha_3 \dots \alpha_n \right| n > 0 \land \left(\forall_{i=1}^{n-1} \alpha_i = \alpha_{i+1} \right) \right\}$
- \Box Activity: For each $\mathcal L$ above, find
 - $|\mathcal{L}| \text{ (the cardinality of the set)}$
 - $\max_{\sigma \in \mathcal{L}} |\sigma|$

Programming Languages

Computer Science and Engineering
The Ohio State University

Q: Are C, Java, Ruby, Python, ... languages in this formal sense?

Programming Languages

- □ Q: Are C, Java, Ruby, Python, ... languages in this formal sense?
- □ A: Yes!
 - \mathcal{L}_{Ruby} is the set of well-formed Ruby programs
 - What the interpreter (compiler) accepts
 - The syntax of the language
- But what does one such string mean?
 - The semantics of the language
 - Not part of formal definition of "language"
 - But necessary to know to claim "I know Ruby"

Regular Expression (RE)

- A formal mechanism for defining a language
 - Precise, unambiguous, well-defined
- □ In math, a clear distinction between:
 - Characters in string (the "alphabet")
 - Metacharacters used to write a RE $(a \cup b)^* a(a \cup b)(a \cup b)(a \cup b)$
- In computer applications, there isn't
 - Is '*' a Kleene star or an asterisk? (a|b) *a(a|b) (a|b) (a|b)

Literals

- A literal represents a character from the alphabet
- □ Some are easy:
 - f, i, s, h, ...
- Whitespace is hard (invisible!)
 - \t is a tab (ascii 0x09)
 - In is a newline (ascii 0x0A)
 - \r is a carriage return (ascii 0x0D)
- So the character '\' needs to be escaped!
 - □ \\ is a \ (ascii 0x5c)

Basic Operators

Computer Science and Engineering
The Ohio State University

- () for grouping, | for choice
- Examples
 - cat|dog|fish
 - h|H)ello (h
 - R(uby|ails)
 - (G|g)r(a|e)y
- □ These operators are meta-characters too
 - To represent the literal: ()

\(61(3|4)\)

Activity: For each RE above, write out the corresponding language explicitly (ie, as a set of strings)

- Set of possible characters
 - (0|1|2|3|4|5|6|7|8|9) is annoying!
- □ Syntax: []
 - Explicit list as [0123456789]
 - Range as [0-9]
- Negate with ^ at the beginning
 - [^A-z] a character that is not a capital letter
- □ Activity: Write the language defined by
 - Gr[ae]y
 - 0[xX][0-9a-fA-F]
 - [Qq][^u]

Character Class Shorthands

Computer Science and Engineering
The Ohio State University

Common

- A for digit, ie [0-9]
- \s for whitespace, ie [\t\r\n]
- \w for word character, ie [0-9a-zA-Z_]
- And negations too
 - D, \S, \W (ie [^\d], [^\s], [^\w])
 - Warning: $[^{d}s] \neq [\D\S]$
- POSIX standard (& Ruby) includes
 - [[:alpha:]] alphabetic character
 - [[:lower:]] lowercase alphabetic character
 - [[:digit:]] decimal digit (in any script)
 - [[:xdigit:]] hexadecimal digit
 - [[:space:]] whitespace including newlines

Wildcards

- □ A . matches any character (almost)
 - Includes space, tab, punctuation, etc
 - But does not include newline
- □ So add . to list of metacharacters
 - Use \. for a literal period
- Examples
 - Gr.y
 - buckeye\.\d
- Problem: What is RE for OSU email address for everyone named Smith?
 - Answer is not: smith\.\d@osu\.edu

Repetition

- Applies to preceding thing (character, character class, or () group)
 - ? means 0 or 1 time
 - * means 0 or more times (unbounded)
 - + means 1 or more times (unbounded)
 - {k} means exactly k times
 - {a,b} means k times, for $a \le k \le b$
- □ More meta-characters to escape!
 - \? * \+ \{ \}

Examples

Computer Science and Engineering
The Ohio State University

🗆 colou?r

- □ smith\.[1-9]\d*@osu\.edu
- 0[xX](0|[1-9a-fA-F][0-9a-fA-F]*)
- □ .*\.jpe?g

Your Turn

- □ (Language consisting of) strings that:
 - Contain only letters, numbers, and ____
 - Start with a letter
 - Do not contain 2 consecutive _'s
 - Do not end with ____
- Exemplars and counter-exemplars:
 - EOF, 4Temp, Test_Case3, _class, a4_Sap_X, S_T_2
- Write the corresponding RE

Your Turn

- □ (Language consisting of) strings that:
 - Contain only letters, numbers, and ____
 - Start with a letter
 - Do not contain 2 consecutive _'s
 - Do not end with ____
- Exemplars and counter-exemplars:
 - EOF, 4Temp, Test_Case3, _class, a4_Sap_X, S_T_2
- Write the corresponding RE

Your Turn (Solution)

- □ (Language consisting of) strings that:
 - Contain only letters, numbers, and ____
 - Start with a letter
 - Do not contain 2 consecutive _'s
 - Do not end with ____
- Exemplars and counter-exemplars:
 - EOF, 4Temp, Test_Case3, _class, a4_Sap_X, S_T_2
- Write the corresponding RE [a-zA-Z] (_[a-zA-Z0-9] | [a-zA-Z0-9]) *

Finite State Automota (FSA)

Computer Science and Engineering
The Ohio State University

□ An FSA is an *accepting machine*

- Finite set of states
- Transition function (relation) between states based on next character in string
 DFA vs NFA
- Start state (s_0)
- Set of accepting states
- An FSA accepts a string if you can start in s₀ and end up in an accepting state, consuming 1 character per step

Example

Computer Science and Engineering
The Ohio State University

□ What language is defined by this FSA?

Example

Computer Science and Engineering
The Ohio State University

What language is defined by this FSA?
 A. Binary strings (0's and 1's) with an even number of 0's

Your Turn

- □ (Language consisting of) strings that:
 - Contain only letters, numbers, and ____
 - Start with a letter
 - Do not contain 2 consecutive _'s
 - Do not end with ____
- Exemplars and counter-exemplars:
 - EOF, 4Temp, Test_Case3, _class, a4_Sap_X, S_T_2
- □ Write the corresponding *FSA*

Solution

Solution (Solution)

Fundamental Results

- Expressive power of RE is the same as FSA
- Expressive power of RE is limited
 - Write a RE for "strings of balanced parens"
 ()(()()), ()(), (((()))), ...
 (((, ())((), ...
 - Can not be done! (impossibility result)
- □ Take CSE 3321...

Computer Science and Engineering
The Ohio State University

REs often used to find a "match"

- A substring s within a longer string such that s is in the language defined by the RE (CSE|cse) ?3901
- Possible uses:
 - Report matching substrings and locations
 - Replace match with something else
- Practical aspects of using REs this way
 - Anchors
 - Greedy vs lazy matching

Anchors

- Used to specify where matching string should be with respect to a line of text
- Newlines are natural breaking points
 - Anchors to the beginning of a line
 - \$ anchors to the end of a line
 - Ruby: \A \z for beginning/end of string
- Examples
 - ^Hello World\$
 - \A[Tt]he
 - ^[^\d].\.jpe?g
 - $end \ . \ z$

Greedy vs Lazy

Computer Science and Engineering
The Ohio State University

 Repetition (+ and *) means multiple matches might begin at same place
 Example: <.*>
 <h1>Title</h1>
 <h1>Title</h1>

- The match selected depends on whether the repetition matching is
 - *greedy*, ie matches as much as possible
 - *lazy*, ie matches as little as possible
- Default is typically greedy
- □ For lazy matching, use *? or +?

Regular Expressions in Ruby

Computer Science and Engineering
The Ohio State University

- Instance of a class (Regexp)
 pattern = Regexp.new('^Rub.')
- But literal notation is common: /pattern/ /[aeiou]*/

%r{hello+} # no need to escape /

- Options post-pended: /pattern/options
 - i ignore case
 - x ignore whitespace, comments ("free spacing")
- □ Match operator =~ (negated as !~)
 - Operands: String and Regexp (in either order)
 - Returns index of *first* match (or nil if not present) 'hello world' =~ /o/ #=> 4

/or/ =~ 'hello' #=> nil

□ Case equality, Regexp === String, \rightarrow Boolean

Strings and Regular Expressions

Computer Science and Engineering
The Ohio State University

- □ Find all matches as an array
 - s.scan /[[:alpha:]]/
- Delimeter for spliting string into array s.split /[aeiou]/
- Substitution: sub and gsub (+/- !)
 - Replace first match vs all ("globally")
 - s = 'the quick brown fox'
 - s.sub /[aeiou]/, '@'

#=> "th@ quick brown fox"

s.gsub /[aeiou]/, '@'

#=> "th@ q@@ck br@wn f@x"

Your Turn: REs in Ruby

. . .

Computer Science and Engineering
The Ohio State University

Check if phone number in valid format phone = '614-292-2900' # bad phone = '(614) 292-2900' # good

format = ? # replace ? with a RE
if phone ? format # replace ? with op
 # phone is well-formatted string

Summary

Computer Science and Engineering
The Ohio State University

- □ Language: A set of strings
- RE: Defines a language
 - Recipe for making elements of language
- Literals
 - Distinguish characters and metacharacters
- Character classes
 - Represent 1 character in RE
- Repetition
- □ FSA

Expressive power same as RE
